

## Topics: Descriptive Statistics and Probability

1. Look at the data given below. Plot the data, find the outliers and find out

$$\mu, \sigma, \sigma^2$$

Name of company	Measure X
Allied Signal	24.23%
Bankers Trust	25.53%
General Mills	25.41%
ITT Industries	24.14%
J.P.Morgan & Co.	29.62%
Lehman Brothers	28.25%
Marriott	25.81%
MCI	24.39%
Merrill Lynch	40.26%
Microsoft	32.95%
Morgan Stanley	91.36%
Sun Microsystems	25.99%
Travelers	39.42%
US Airways	26.71%
Warner-Lambert	35.00%

**Answer -:**

**Measure\_x=pd.Series([24.23,25.53,25.41,24.14,29.62,28.25,25.81,24.39,40.26,32.95,91.36,25.99,39.42,26.71,35.00])**

```
name=['Allied Signal','Bankers Trust','General Mills','ITT Industries','J.P.Morgan & Co.','Lehman Brothers','Marriott','MCI','Merrill Lynch','Microsoft','Morgan Stanley','Sun Microsystems','Travelers','US Airways','Warner-Lambert']
```

```
# Pie Plot
```

```
plt.figure(figsize=(6,8))
```

```
plt.pie(Measure_x,labels=name,autopct='%1.0f%%')
```

```
plt.show()
```

```
plt.boxplot(Measure_x)
```

```
plt.title("boxplot")
```

**Measure\_x.mean()**

**33.27133333333333**

**Measure\_x.median()**

**26.71**

**Measure\_x.var()**

**287.1466123809524**

**Measure\_x.std()**

**16.945400921222028**

---

2.

Answer the following three questions based on the box-plot above.

- (i) What is inter-quartile range of this dataset? (please approximate the numbers) In one line, explain what this value implies.

**Answer -:** (Inter-Quartile Range)  $IQR = Q3 - Q1 = 12 - 5 = 7$

**Second Quartile Range is the Median Value**

- (ii) What can we say about the skewness of this dataset?

**Answer -:** Right-Skewed median is towards the left side it is not normal distribution

- (iii) If it was found that the data point with the value 25 is actually 2.5, how would the new box-plot be affected?

**Answer -:** In that case there would be no Outliers on the given dataset because of the outlier the data had positive skewness it will reduce and the data will normal distributed

---

3.

Answer the following three questions based on the histogram above.

- (i) Where would the mode of this dataset lie?

**Answer -:** The mode of this data set lie in between 5 to 10 and approximately between 4 to 8 .

- (ii) Comment on the skewness of the dataset.

**Answer-:** Right-Skewed.  $\text{Mean} > \text{Median} > \text{Mode}$

- (iii) Suppose that the above histogram and the box-plot in question 2 are plotted for the same dataset. Explain how these graphs complement each other in providing information about any dataset.

**Answer -:** They both are right-skewed and both have outliers the median can be easily visualized in box plot where as in histogram mode is more visible.

- 
4. AT&T was running commercials in 1990 aimed at luring back customers who had switched to one of the other long-distance phone service providers. One such commercial shows a businessman trying to reach Phoenix and mistakenly getting Fiji, where a half-naked native on a beach responds incomprehensibly in Polynesian. When asked about this advertisement, AT&T admitted that the portrayed incident did not actually take place but added that this was an enactment of something that “could happen.” Suppose that one in 200 long-distance telephone calls is misdirected. What is the probability that at least one in five attempted telephone calls reaches the wrong number? (Assume independence of attempts.)

**Answer -:**

**probability of call misdirecting =  $1/200$**

**Probability of call not Misdirecting =  $1 - 1/200 = 199/200$**

**Number of Calls = 5**

$$P(x) = {}^nC_x p^x q^{n-x}$$

$$n = 5$$

$$p = 1/200$$

$$q = 199/200$$

**at least one in five attempted telephone calls reaches the wrong number**

**= 1 - none of the call reaches the wrong number**

$$= 1 - P(0)$$

$$= 1 - {}^5C_0 (1/200)^0 (199/200)^{5-0}$$

$$= 1 - (199/200)^5$$

$$= 0.02475$$

**probability that at least one in five attempted telephone calls reaches the wrong number = 0.02475**

- 
- 
5. Returns on a certain business venture, to the nearest \$1,000, are known to follow the following probability distribution

x	P(x)
-2,000	0.1
-1,000	0.1
0	0.2
1000	0.2
2000	0.3
3000	0.1

**Answer -:**

<b>X</b>	<b>P(X)</b>	<b>E(X)= X . P(X)</b>	<b>E(X<sup>2</sup>) = X<sup>2</sup> . P(X)</b>
<b>-2,000</b>	<b>0.1</b>	<b>-200</b>	<b>400000</b>
<b>-1,000</b>	<b>0.1</b>	<b>-100</b>	<b>100000</b>
<b>0</b>	<b>0.2</b>	<b>0</b>	<b>0</b>
<b>1000</b>	<b>0.2</b>	<b>200</b>	<b>200000</b>
<b>2000</b>	<b>0.3</b>	<b>600</b>	<b>1200000</b>
<b>3000</b>	<b>0.1</b>	<b>300</b>	<b>900000</b>
<b>Total</b>		<b>800</b>	<b>2800000</b>

- (i) What is the most likely monetary outcome of the business venture?

**Answer -:** Most likely monetary outcome of the business venture is \$2000 as it has maximum Probability 0.3

- (ii) Is the venture likely to be successful? Explain

**Answer -:** Yes, the probability that the venture will make more than 0 or a profit

$$p(x > 0) + p(x > 1000) + p(x > 2000) + p(x = 3000) = 0.2 + 0.2 + 0.3 + 0.1 = 0.8$$

this states that there is a good 80% chances for this venture to be making a profit

- (iii) What is the long-term average earning of business ventures of this kind? Explain

**Answer -:** The long-term average is Expected value =  $\sum (X * P(X)) = 800\$$  which means on an average the returns will be + 800\$

- (iv) What is the good measure of the risk involved in a venture of this kind? Compute this measure

**Answer -:** The good measure of the risk involved in a venture of this kind depends on the Variability in the distribution. Higher Variance means more chances of risk

$$\begin{aligned}\text{Var}(X) &= E(X^2) - (E(X))^2 \\ &= 2800000 - 800^2 \\ &= 2160000\end{aligned}$$
